

Risk Factors¹

- Tobacco use and excessive alcohol use are the two major risk factors for developing oral cancer. Individuals who are heavy users of both tobacco and alcohol are at especially high risk.
- Infection with the human papillomavirus (HPV) may be the cause of some types of oral cancers.
- Steps that an individual can take to prevent oral cancer include not using tobacco products and limiting alcohol consumption.

Warning Signs and Symptoms¹

- Earlier symptoms include persistent growths or sores in the mouth or throat.
- Later symptoms include trouble chewing, swallowing, or moving the mouth.

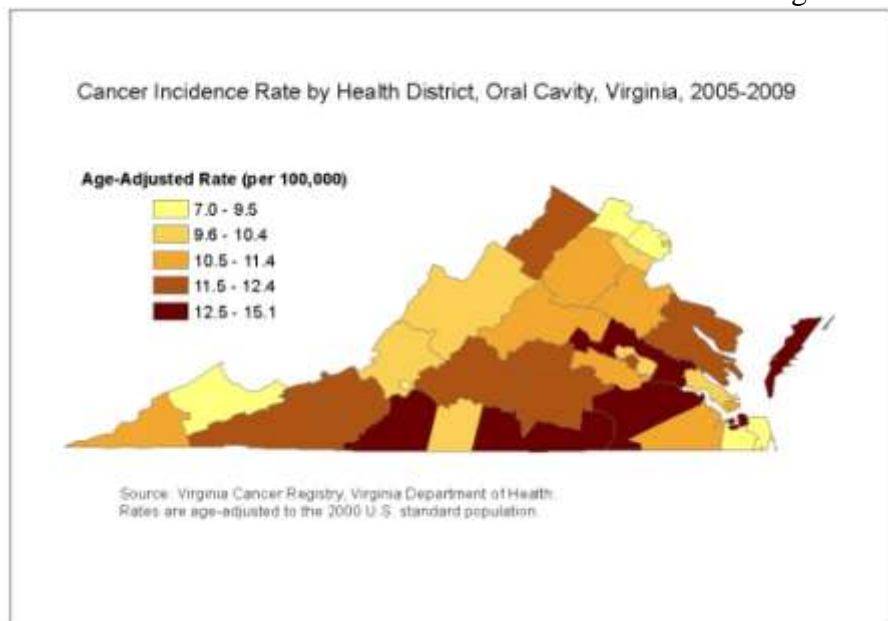

Early Detection¹

- An examination of the mouth and throat by a dentist or primary care physician

Oral Cancer Facts

- Oral cancer is among the top ten most commonly diagnosed cancers among men but not among women in the United States. It is relatively rare as a cause of death. Incidence and mortality rates in both men and women have fallen over the last couple of decades.¹
- Over the 2005-2009 time period, the incidence rate of oral cancer in Virginia was 10.5 cases per 100,000.² (U.S. rate=10.8 cases per 100,000)³
- Figure 1 shows incidence rates of oral cancer by health district in Virginia. Eastern Shore, Norfolk, and Portsmouth had the highest incidence rates of oral cancer among the 35 health districts.²
- Over the 2006-2010 time period, the mortality rate from oral cancer in Virginia was 2.3 deaths per 100,000.⁴ (U.S. rate=2.4 deaths per 100,000)⁵
- Incidence rates were higher in men compared to women in Virginia. The incidence rate was similar for African-American males (16.4 per 100,000) and white males (16.3 per 100,000) and

Figure 1

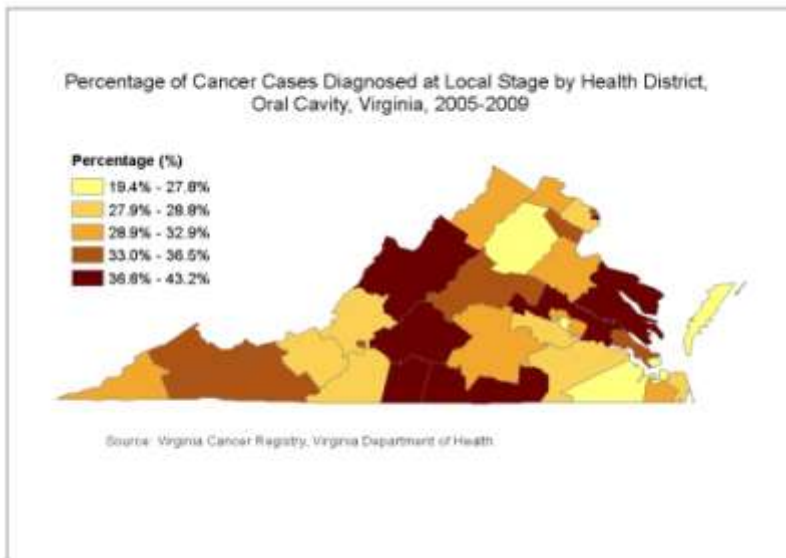

Oral Cavity Cancer in Virginia

was higher among white females (5.9 per 100,000) compared to African-American females (4.6 per 100,000).²

- Mortality rates were higher in men compared to women in Virginia. The mortality rate was higher in African-Americans compared to whites due to an especially high death rate in African-American males. (Mortality rate=5.3 per 100,000 for African-American males, 3.4 per 100,000 for white males, 1.5 per 100,000 for African-American females, and 1.2 per 100,000 for white females).⁴
- Oral cancer has a five-year relative survival rate of 82 percent if diagnosed in its earliest (local) stage when it is most curable.¹ In Virginia, 31 percent of oral cancer diagnosed was local stage.²

Figure 2

- Figure 2 shows the percentage of oral cancers diagnosed local stage by health district. Norfolk, Portsmouth, and Western Tidewater had the lowest percentages of oral cancer cases diagnosed local stage among the 35 health districts.²

- The percentage of oral cancers diagnosed local stage was lower for males compared to females and for African-Americans compared to whites.²

Figure 3

- According to recent state health behavior survey data, about 4% of adults aged 18 years and older reported currently using smokeless tobacco, a major risk factor for oral cancer. About 45% of adults aged 40 years and older reported that they had an oral cancer examination in the previous year.⁶
- Figure 3 shows the prevalence of smokeless tobacco use by health district in Virginia. Cumberland Plateau, Lenowisco, and Mount Rogers had the highest percentages of smokeless tobacco use among the 35 health districts.⁶

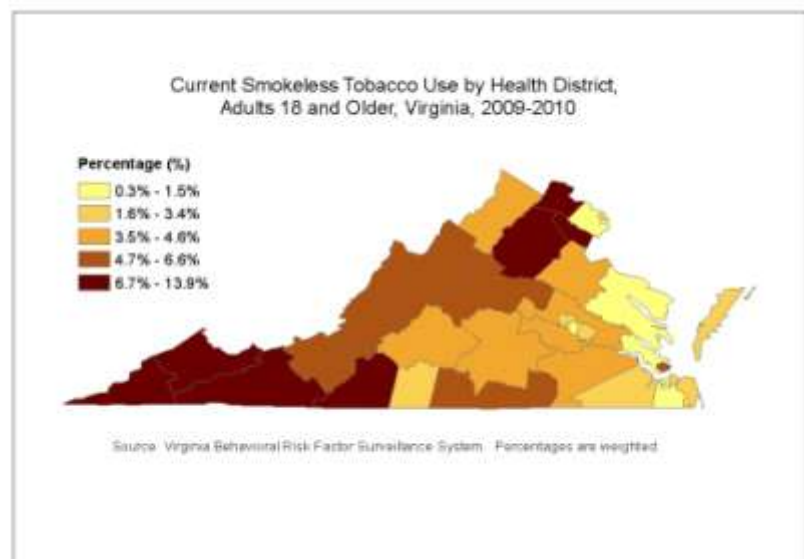

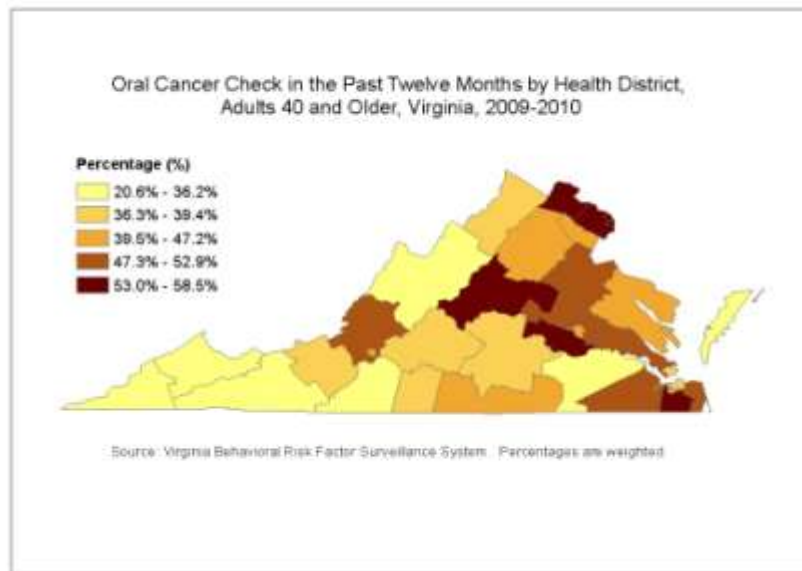

Figure 4

- Figure 4 shows the percentage of adults 40 years and older reporting an oral cancer examination in the previous year by health district in Virginia. Cumberland Plateau, Mount Rogers, and Lenowisco had the lowest prevalence of oral cancer screening among the 35 health districts.⁶

- Smokeless tobacco use was higher among white males (8%) and African-American males (7%) compared to white and African-American females (1%). Smokeless tobacco use was more prevalent among adults who were

less educated.⁶

- Oral cancer screening was less prevalent in African-Americans compared to whites and in adults who were less educated, lower income, and did not have insurance.⁶
- In Virginia in 2010, there were 381 inpatient hospitalizations for oral cavity cancer, at a total cost of over \$23 million. The average length of stay was 7.6 days and the average charge per stay was \$61,286.⁷
